

## Renewable Energy: Basic Principles and Use in our Society

**Department:** Fudan International Summer Session 2026

<b>Course Code</b>	GEIS10006						
<b>Course Title</b>	Renewable Energy: Basic Principles and Use in our Society						
<b>Credit</b>	2	<b>Experiment (including Computer) Credit</b>		<b>Practice Credit</b>		<b>Aesthetic Education Credit</b>	
<b>Credit Hours Per Week</b>	9 credit hours per week, 36+3 tutorial hours in total (one credit hour is 45 minutes)	<b>Education on The Hard- Working Spirit Credit Hours</b>		<b>Language of Instruction</b>		<b>Honors Course</b>	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
<b>Course Type</b>	<input type="checkbox"/> Core General Education Course <input type="checkbox"/> Specific General Education Course <input type="checkbox"/> Basic Course in General Discipline <input checked="" type="checkbox"/> Others			2+X Major : <input type="checkbox"/> Professional Core Course <input type="checkbox"/> Professional Advanced Course Non 2+X Major : <input type="checkbox"/> Professional Compulsory Course <input type="checkbox"/> Professional Elective Course			
<b>Course Objectives</b>	To introduce Chinese and international students to the general knowledge of renewable energy (RE), including global energy needs; RE sources and potential; processes for RE generation, usage, storage and transportation; local applicability; and current frontiers of developments. To then guide students to more specialized areas of technical, environmental or policy-based aspects, with special focus on system integration and sustainable development.						
<b>Course Description</b>	This course is designed for 1 <sup>st</sup> -4 <sup>th</sup> grades undergraduates of all disciplines and background. The contents of the course will include both general and specialized options, with the latter designed to accommodate students of non-science and technology backgrounds. The general knowledge includes basic concepts in energy and energy systems, types of energy and their supply and demand, and major categories of RE sources and potential. Considering the varied background of the students, the contents will be more inclined towards overview instead of technical details. The course will then move on to bioenergy, introducing various categories such as energy crops, agricultural and industrial waste,						

municipal waste, and algae as RE feedstock, and outline the related thermal, physical, chemical and biological processes. The material will then be examined through integrated lenses such as i) process optimization, ii) integration into existing energy and economy network, and iii) balanced sustainable development objectives.

In addition, as a response to rapid changing global vista, Transdisciplinary Competencies for Sustainability will be a new focus of this course, providing learning opportunities for understanding challenges in policy-society and science-policy interfacing; plural perspectives; envisioning; and critical thinking. Such objectives will be facilitated by various activities including debates, role playing, and content synthesis during teaching, when possible.

**Course Requirements:**

The course will be taught by three lecturers, primarily in English but with Chinese learning aid if required. One guest lecturer might be invited to deliver some specialized contents, according to the course schedule and students' interest. Students from all disciplines will be accommodated, but it is recommended that they possess a basic knowledge in a natural science. Moderate-to-good English ability will also be helpful. The teaching team may be adjusted in the future according to the needs and interests of the students.

**Teaching Methods:**

The course credit will be 2, with a total teaching period of 36 credit hours, and an additional tutorial section of 3 hours. The main part of the course will be lectures using interactive class activities, including case studies, short discussions, questions and answers, and games. One off-campus visit or guest lecture might be arranged. The course will contain one mid-term test on the content taught so far, in the form of open-ended questions. One open-scope and individualized assignment will be designed for each student, based on interactive discussions between the students and the lectures. The assignment will be due at the end of the term and taken as the final assessment. A written report and an oral presentation will be delivered by each student as a form of interactive learning.

**Course Director's Academic Background:**

**Instructor's Academic Background:**

The lead lecturer is Prof. Marie Harder, a Foreign Thousand Talent professor of Fudan since 2011. During her academic career at Brighton University, UK. Professor Harder has had extensive research and teaching experience in both natural and social sciences, including waste management and recycling, renewable energy, sustainable development, and values systems. Since she joined Fudan, her research interest has partly been focused on comprehensive municipal waste treatment and reutilization, including waste sorting, biogas production, and behavioral change. Her multi-disciplinary expertise and comprehensive experience will be an invaluable asset to the course.

Prof. Harder will be assisted and understudied by Assoc. Prof. Zhang Yi, who specializes in environmental engineering and biological processes, but is also of considerable experience in the field of renewable energy and biomass feedstock. She will focus on solar energy, algae and biodiesel, energy storage, and system integration, as well as provide Chinese teaching aid and organize class activities.

Prof. Xiuping Zhu will further expand the course with her research experience on water/wastewater treatment and renewable energy recovery. She joined Fudan University in September, 2021, as a Young Thousand Talent professor. She will teach the contents on wind, hydro and ocean energy, energy from waste, and electricity and grid.

**Members of Teaching Team**

<b>Name</b>	<b>Gender</b>	<b>Professional Title</b>	<b>Department</b>	<b>Responsibility</b>
Marie Harder	Female	Professor	Environment	Lead Lecturer
Zhang Yi	Female	Associate Professor	Environment	Lecturer
Zhu Xiuping	Female	Professor	Environment	Lecturer

**Course Schedule :**

**Week I:**

Session 1: Introduction and overview (Zhang Yi and Marie Harder)

General background on energy, energy generation and usage (historical, and current), GHG and global climate change: How renewables can help sustainability problems; explanation on course evaluation

Session 2: Traditional energy carrier and transportation; Introduction to bioenergy (Zhang Yi & Marie Harder)

Traditional energy carriers, fossil fuels and their characteristics; energy transportation in solid, liquid and gaseous forms; Biomass and waste, photosynthesis and energy crops, biomass and thermal processes for bioenergy generation

Session 3: Renewable energy from the Sun - Direct solar energy (Zhang Yi)

Basic physical concepts in energy and energy systems; Solar radiation and insolation, passive solar, solar thermal and solar PV; centralized and decentralized systems

**Week II:**

Session 4: Renewable energy from the Sun - Hydro and wind energy (Zhu xiuping)

Hydropower, Large hydro and pumped storage, wind turbine and wind farm; China perspective

Session 5: Renewable energy from the Ocean (Zhu Xiuping)

Wave, tidal, salinity gradient, ocean current and thermal energy

Session 6: Renewable energy from the Earth (Zhu Xiuping & Marie Harder)

Geothermal energy for heat and power generation; nuclear fission and fusion, nuclear waste disposal and social concern; China perspective; initiation of the major assignment

**Week III:**

Session 7: Algae and its conversion to biodiesel (Zhang Yi)

Algae and its growth, algae lipids, algae harvest, processing and conversion to biodiesel

Session 8: New energy crops, farm waste and municipal sludge to biofuel (Zhang Yi)

Fermentation and production of bioethanol from energy crops; anaerobic digestion and production of biogas from municipal waste and farm waste

Session 9: System integration and mid-term (Marie Harder & Zhang Yi)

Municipal solid waste and its reutilization, hybrid systems, social and environmental concerns; case study;

mid-term test and updates on the major assignment

**Week IV:**

**Tutorial** (Zhang Yi)

Session 10: Electricity generation, transmission, and distribution; heat distribution (Zhang Yi)

Power generation in thermal plants, electricity grid and transmission; demands for heating and cooling, industrial waste heat reutilization

Session 11: Energy storage and conversion (Zhang Yi)

Heat storage; battery and supercapacitor for electricity storage; energy conversion for RE storage

Session 12: Final assessment based on the major assignment

The form of assessment will be explained in the 1<sup>st</sup> session, and its topic gradually shaped during the course through interactive discussions. A presentation and a written report will be delivered in the last session.

**The design of class discussion or exercise, practice, experience and so on:**

Short discussion sessions will be integrated into the lectures, and one off-campus visit might be arranged, to renewable energy related facilities like waste incineration plant, biogas plants and wind farms. Questions might be given at the end of a session, to be answered and discussed in the next one. Teaching aids, both real and virtual, might be used. One major assignment will be given to all the students, which is to be finished by the end of the term. In the last session, students will give presentations on their assignments, to introduce their classmates to various topics of renewable energy.

**If you need a TA, please indicate the assignment of assistant:**

One TA is required, with good communication skills and oral English capacity.

**Grading & Evaluation :**

**Class attendance and participation** in discussions will make up for 25% of the total mark, and one **mid-term test** in written form will constitute 15%. The test will be on the contents taught so far, in the form of open-ended questions.

The rest 60% of the total credit will be given based on the quality of the **major assignment**. The form of the assignment will be introduced in the 1<sup>st</sup> session, and explained again at the end of the 2<sup>nd</sup> week. The topic of the assignment will be renewable energy related, contemporary and forward thinking. An example is given as: the recent history, current application and future development of certain RE type in certain country/industry. The students will propose an intended topic and start interactive discussions with the lecturers after the 2<sup>nd</sup> week. In the next week, the topic will be reviewed and updated, and finally determined by the individual student and the lecturers together, after the mid-term test at the end of the 3<sup>rd</sup> week.

The assignment will include a written report and an oral presentation, making up for 40% and 20% of the total credits, respectively. The students will conduct in-depth research on the proposed or assigned RE related topic, and produce a report mainly containing a portfolio. The portfolio will include 5 articles that the students consider most relevant and chosen to represent the topic. A short summary will be written on these articles, to provide the most critical information in this area. The students will also explain why, among all the literature they have reviewed, they chose these 5 articles. The sources of these literature will be appended in the report, and the students will also answer several critical-thinking questions posed by the instructors. Checks of the report's progress will be conducted every session, and the final assessment held at the end of the term. In the final form, the assignment will include a presentation to the whole class, the written answers to the questions, and the written summary, and the portfolio including the sources of the various literature.

**Usage of Textbook:**  Yes (complete textbook information form below)  No

**Textbook Information** (No more than two textbooks) :
